

The Consilience Framework: From Valuation Theory to the Void — A Cross-Domain Synthesis

Rowan Quni-Gudzinis (QNFO/QWAV)

2026-08-04

Abstract

This memo synthesizes two deep-dive conversations on valuation theory and foundational mathematics into a unified framework. We trace the complete hierarchy from the void (unmarked state) through the calculus of distinctions (Laws of Form), ZFC set theory, and Ostrowski's theorem, arriving at a cross-domain consilience: the recognition that Archimedean (continuous, additive) and non-Archimedean (ultrametric, hierarchical) measurement geometries are not merely mathematical curiosities but represent the two fundamental modes of structure generation — “accumulated effort” vs. “shared ancestry.” We provide a Universal Consilience Prompt template for automated cross-domain translation of mathematical theorems, an autonomous four-phase LLM research workflow, and explicit mappings onto the QNFO WBS pillars (UMP, SLB, INM, CFE, RES). The kernel insight is that valuation theory, properly understood, bridges the gap between the pre-distinction void and all structured knowledge.

1. The Two Conversations

This paper synthesizes two interconnected research discussions conducted on 2026-08-04, spanning approximately 60,000 words of dialogue. The first conversation explored valuation theory — its mathematical structure, its applications across cryptography/quantum computing/topology, and its potential as a unifying framework for interdisciplinary research. The second pushed the question one level deeper: if valuation theory sits at Level 4 of abstraction, what sits at Levels 3, 2, 1, and ultimately at Level 0?

The answers form a single, coherent hierarchy:

Level	Concept	Domain	WBS Pillar
0	The Void / Unmarked State	Pure potentiality, pre-distinction nothingness	SLB
1	Distinction Calculus (Laws of Form)	The primitive act of drawing a boundary	SLB
2	First-Order Logic + ZFC	Formal membership, quantifiers, sets	— (foundation)
3	Order, Topology, Measure, Category Theory	Structural scaffolding	UMP
4	Valuation Theory (Ostrowski)	Specific measurement geometries on fields	UMP, INM
5	Applications (crypto, quantum, AI, cognition)	Domain-specific instantiations	CFE, RES

This hierarchy is not merely taxonomic — it is **generative**. Each level emerges from the one below it through a single recursive operation: **drawing a distinction**. The entire edifice of mathematics, physics, and information theory can be understood as the cascading consequences of this one primitive act.

2. Part I: Valuation Theory — The Ostrowski Legacy

2.1 The Core Machinery

Valuation theory asks: *How can we measure the “size” of a number?* The familiar answer is the standard absolute value, leading to the real numbers $\mathbb{R}$. Ostrowski’s theorem (1916) reveals that this is merely one of an infinite family of completions:

Ostrowski's Theorem. Every nontrivial valuation on $\mathbb{Q}$ is equivalent to either: 1. The usual absolute value, completing to $\mathbb{R}$, or 2. The p -adic absolute value for some prime p , completing to $\mathbb{Q}_p$.

The Archimedean completions ($\mathbb{R}$, $\mathbb{C}$) are exactly two — a striking anomaly. The non-Archimedean completions $\mathbb{Q}_p$ are infinite in number, one for each prime. This asymmetry is the first clue that something deep about the structure of measurement itself is being revealed.

2.2 The Key Distinction: Two Modes of “Distance”

- **Archimedean (Real):** Distance equals *accumulated effort*. Adding many small things eventually makes a big thing. The triangle inequality is $|x + y| \leq |x| + |y|$. This is the geometry of continuous space, classical forces, gradient descent, and Shannon entropy.
- **Non-Archimedean (p-adic):** Distance equals *shared ancestry*. The strong triangle inequality $|x + y| \leq \max(|x|, |y|)$ means the largest term dominates — smaller terms vanish. This is the geometry of hierarchical trees, quantum superposition, recursive algorithms, and Kolmogorov complexity.

2.3 Applications Across Domains

The p-adic framework has proven applications in:

- **Number Theory:** The native language of modern algebraic number theory — Diophantine equations, Galois representations, the proof of Fermat's Last Theorem
- **Cryptography:** p-adic lattice-based cryptography, isogeny-based cryptography, homomorphic encryption overflow management
- **Quantum Mechanics:** Topos-theoretic reformulations of quantum foundations, p-adic quantum mechanics (since the late 1980s), adelic quantum gravity
- **Quantum Computing:** Ultrametric error-correcting codes, topological quantum computing via TQFTs
- **Machine Learning:** p-adic neural networks, hierarchical inference replacing gradient descent with valuation descent
- **Topology:** Totally disconnected Hausdorff spaces, valuative trees, Zariski topology on spaces of valuations

2.4 Existing QNFO Work

This repo already contains substantial work directly relevant:

- **hensel-code-system/paper.md:** “Exact Rational Arithmetic via p-adic Hensel Codes: A Computation-Ready Framework Resolving the Ostrowski Gap” — formalizes the computational gap between Archimedean approximation and exact p-adic arithmetic
- **adelic-qft/:** 13+ modules on adelic quantum field theory, connecting p-adic and Archimedean physics through the adèle ring
- **unity-of-ultrametric-physics/:** 18 chapters + appendices providing the comprehensive case for ultrametric geometry as the correct physical framework
- **arithmetic-gauge/:** 40+ documents exploring the gauge-theoretic interpretation of arithmetic structures

- **different-physics/**: Alternative physical frameworks grounded in ultrametric principles

3. Part II: The Cross-Domain Rosetta Stone

The core methodological contribution of the first conversation is a **cross-domain lexicon** that translates valuation-theoretic concepts into the native languages of Physics, Computer Science, Cognitive Science, and Information Theory.

3.1 The Valuation (“The Ruler”)

Domain	Translation
Pure Math	A function assigning “size” by measuring divisibility by prime p
Physics	A spectral energy ladder — discrete quanta of action
CS	Nesting depth in a tree/JSON — hierarchy traversal cost
Cognitive Science	Taxonomic specificity — abstraction levels from instance to root category

3.2 Non-Archimedean vs. Archimedean (“Combining Rules”)

	Archimedean	Non-Archimedean
Math	$ x + y \leq x + y $	$ x + y \leq \max(x , y)$
Physics	Classical force accumulation	Quantum superposition (dominant amplitude wins)
CS	Gradient descent	Recursive DFS (deepest branch dictates runtime)
Info Theory	Shannon entropy (additive)	Kolmogorov complexity (longest pattern dictates size)
Cognition	Incremental learning	Categorical perception (strongest category dominates)

3.3 Ostrowski’s Theorem (“The Great Either/Or”)

- **Math**: Only two fundamentally different types of “size” exist on $\mathbb{Q}$
- **Physics**: Nature’s geometry is a binary choice — smooth spacetime (GR) OR discretely fractal spacetime (QG)
- **Epistemology**: Every measurement system is either purely quantitative (smooth, additive) OR purely categorical (hierarchical, discrete) — no smooth blend

3.4 Ultrametric Topology (“The Geometry of Balls”)

- **Math**: Balls are either disjoint or nested; every point in a ball is its center

- **Physics:** Quantum entanglement forms closed, isolated cliques — measuring one member instantly collapses the entire ball
- **CS:** B-Trees and hierarchical clustering — no fuzzy edges between categories
- **Cognition:** Concept hierarchies where membership is all-or-nothing at each level

3.5 The Convergent Principle

When all translations are laid side-by-side, a single meta-principle emerges:

“In an Archimedean world, distance equals accumulated effort. In a non-Archimedean world, distance equals shared ancestry.”

Two entities are “close” in p-adic space not because they are physically adjacent, but because they descend from the same recursive function, prime factor, or quantum branching node. Causality and correlation are **hierarchical, not spatial**.

This is the **consilience kernel** — the recognition that the same structural dynamic (hierarchical measurement via shared ancestry) appears independently across every domain where tree-like, recursive, or modular organization matters.

4. Part III: The Foundational Ladder

The second conversation pushed beyond valuation theory to ask: *What is most fundamental?*

4.1 Level 3 → Level 2: The Mathematical Bedrock

Level	Framework	What It Provides
5	Valuation Theory	Specific measurement geometries
4	Category / Topos Theory	Grammar of mathematical relationships
3	Order, Topology, Measure	Frameworks for hierarchy, closeness, size

All of these are built within:

2 | **ZFC Set Theory + First-Order Logic** | Universe of sets, rules of deduction |

ZFC is the current mathematical consensus for “most fundamental.” But it has a catch: Gödel’s incompleteness theorems show that ZFC cannot prove its own consistency. It is a *framework*, not a self-justifying truth.

4.2 Level 2 → Level 1: The Distinction Calculus

ZFC rests on a single primitive: the membership relation $\in$. An element either *is* or *is not* in a set. This binary yes/no is the atom of all mathematical existence.

But where does $\in$ come from? Spencer-Brown’s *Laws of Form* (1969) provides the answer: **the act of drawing a distinction**.

| “Draw a distinction.” — G. Spencer-Brown, *Laws of Form*, opening instruction

Before you can have: - A set, you must distinguish member from non-member - A bit, you must distinguish 0 from 1 - A valuation, you must distinguish divisible from non-divisible - A quantum measurement, you must distinguish measured from unmeasured

Therefore, **distinction is the only primitive concept**. Everything else — logic, sets, numbers, valuations, topologies, spacetime — is a derived structure born from recursively applying this single act.

4.3 Level 1 → Level 0: The Void

If distinction is the first act, what precedes the act?

The unmarked state. The void. Pure potentiality.

In Spencer-Brown’s formalism, the universe begins with a blank page — a state of complete undifferentiation. This “nothing” is not emptiness in the sense of a container; it is the **absence of all form, all information, all structure**.

Domain	The Void
Math	The empty set $\emptyset$ before it is named; pure potential for sets
Physics	The quantum vacuum — not empty space, but a field of pure potentiality where virtual particles arise
Info Theory	Zero entropy — perfect symmetry, no bit has been flipped
Cognition	Pre-conceptual awareness — before object permanence, before thought

4.4 The Paradox

Here is the central paradox of fundamentality:

| **The most fundamental “thing” is not a thing — it is the condition for the possibility of things.**

To name the void is to draw a distinction between “void” and “not-void,” which immediately violates its nature. The very act of asking “what is more fundamental?” is itself a distinction. The question creates the separation it seeks to transcend.

4.5 The Extended Chain (Three Paths)

The second conversation identified three paths forward. These are explored in detail in [foundational-chain.md](#) (generated concurrently with this paper):

1. **Formalize the Void via Category Theory:** The void as the initial object 0, distinction as the subobject classifier Ω , the arrow $0 \rightarrow 1$ as the universal morphism that generates all structure. Connection to Lawvere-Tierney topology and homotopy type theory.

2. **Apply to Quantum Vacuum / Spacetime Emergence:** The adèle ring $\mathbb{A}_{\mathbb{Q}} = \mathbb{R} \times \prod_p \mathbb{Q}_p$ as the mathematical object that unifies all possible completions of the void. Bruhat-Tits trees as the geometry of the first distinctions. Prediction: spacetime emerges from the tension between Archimedean and non-Archimedean completions.
 3. **Minimum Entropy for “Booting” a Universe:** $S = 0$ (void) $\rightarrow S = k_B \ln 2$ (first distinction) $\rightarrow$ recursive cascade. Kolmogorov complexity of the void: $K(\text{void}) = 0$. The minimum program: the recursive distinction operator.
-

5. Part IV: The Universal Consilience Prompt

The first conversation produced a structured prompt template designed for automated cross-domain translation of mathematical theorems. This is now implemented as an MCP tool (see /consilience-mcp/server.py).

5.1 The Prompt Template

SYSTEM ROLE: Universal Consilience Translator (UCT)

Your task is to translate a given mathematical theorem/object into four distinct

domain lexicons: Physics, Computer Science, Cognitive Science, and Information Theory.

RULES FOR TRANSLATION:

1. No Math Jargon: Unless strictly necessary. Replace "field", "valuation", "topology" with structural analogues.
2. Find the Dynamic: Identify what the theorem DOES – e.g., "classifies", "lifts solutions", "binds variables", "imposes orthogonality".
3. Mandatory Output Structure: Respond strictly in the following JSON format.

INPUT RECEIVED:

[Mathematical Statement/Theorem]

OUTPUT:

```
{
  "Core_Dynamic": "A one-sentence, jargon-free summary of the mechanism.",
  "Domain_Translations": {
    "Physics": {
      "Lexicon": "[Translates terms to energy/fields]",
      "Instance": "[Real-world quantum/relativistic analogy]",
      "Ramification": "[What breaks or is solved if this is true?]"
    },
    "Computer_Science": {
      "Lexicon": "[Translates to data structures/algorithms]",
      "Instance": "[Real-world DB/AI/Networking analogy]",
      "Ramification": "[Impact on complexity or scaling]"
    }
  }
}
```

```
    },
    "Cognitive_Science": {
      "Lexicon": "[Translates to perception/learning/hierarchies]",
      "Instance": "[Human reasoning/neural net analogy]",
      "Ramification": "[Effect on induction or category formation]"
    },
    "Information_Theory": {
      "Lexicon": "[Translates to entropy/coding/channels]",
      "Instance": "[Compression/transmission analogy]",
      "Ramification": "[Effect on signal integrity or capacity]"
    }
  },
  "Synthesis_Consilience": "A unified meta-principle connecting all four
translations
into a single convergent insight."
}
```

5.2 Demonstration: Hensel’s Lemma

Input: “If a polynomial equation has a simple root modulo a prime p , then this root lifts uniquely to a root in the p -adic integers.”

Core_Dynamic: “Local approximate solutions guarantee globally exact solutions, provided the approximation is not ambiguous (derivative $\neq 0$).”

Domain Translations:

Domain	Lexicon	Instance	Ramification
Physics	Coarse-grained fixpoint → UV-complete Lagrangian	Renormalization Group flow: if a theory is stable at low energy, it uniquely lifts to a precise UV theory	Nature cannot have ambiguous intermediate scales; exact macro symmetries dictate unique micro laws
CS	Approximate match → Hash collision resolution	Iterative deepening / SAT solving: if partial assignment satisfies low-bit clauses, it extends deterministically to full solution	Gradient-free optimization in discrete spaces is not NP-hard when local minima are “simple”
Cognitive	Abstract schema → Exemplar refinement	Child’s rough categorical rule lifts uniquely to exception-less taxonomy if base concept is non-ambiguous	Concept formation follows deterministic lifting; ambiguous base concepts prevent higher learning
Info Theory	Noisy symbol → Unique decodable code	Prefix code valid at coarse resolution lifts uniquely to	Lossy compression can be made lossless without

Domain	Lexicon	Instance	Ramification
		optimal infinite-sequence coding	entropy penalty if initial quantization is “simple”

Synthesis_Consilience: “Truth propagates upward in strictly hierarchical systems, provided the foundation is unambiguous. Ambiguity (a zero derivative) at the root is the sole barrier to infinite precision.”

6. Part V: Autonomous LLM Research Workflow

The conversation produced a four-phase autonomous research loop that enables an LLM to conduct interdisciplinary mathematics research without human hand-holding. This is implemented as the MCP tool `full_pipeline()`.

6.1 The Four Phases

Phase A: Corpus Ingestion

Input: 5+ seminal abstracts from pure math + 5+ from applied physics/CS
Action: Extract all mathematical "verbs" (classifies, lifts, decomposes, bounds, approximates, completes, embeds, restricts, factors)
Output: Structured list of theorems with their `Core_Dynamic` tags

Phase B: Cross-Mapping

Input: Each extracted theorem from Phase A
Action: Run the Universal Consilience Prompt on every theorem
Output: Vector of {`Core_Dynamic`, `Domain_Translations`, `Synthesis_Consilience`}

Phase C: Pattern Matching

Input: All `Synthesis_Consilience` outputs from Phase B
Action: Cluster into meta-principles. Identify gaps:
"Which principle is most proven in Physics but unproven in CS?"
"Which is well-established in Info Theory but absent in Cognition?"
Output: Gap matrix – the novel hypothesis zones

Phase D: Generative Transfer

Input: A gap from Phase C (proven domain + unproven domain)
Action: Using only translated lexicons, draft a novel theorem in the target domain analogous to the source domain principle
Output: Novel theorem, proof sketch, experimental validation protocol

6.2 Why This Works

The workflow forces the LLM to reason through **translated lexicons** rather than domain-specific jargon. By operating at the level of *structural dynamics* (`Core_Dynamic`), the LLM naturally identifies cross-domain isomorphisms that would be invisible at the notation level. This is the computational instantiation of consilience.

6.3 Integration with Existing QNFO Infrastructure

This workflow is designed to plug into QNFO's existing infrastructure: - **D1 database**: Store extracted theorems and translations - **Vectorize**: Semantic search across Core_Dynamic embeddings - **Knowledge Graph**: Link theorems, domains, and meta-principles - **Cloudflare Workers**: Deploy as a serverless API endpoint

7. Part VI: QNFO WBS Integration

The complete synthesis maps naturally onto the QNFO Work Breakdown Structure (WBS) pillars:

7.1 UMP — Ultrametric Physics

WBS Code: QNFO.UMP

This is the primary domain of valuation theory. The Ostrowski classification, p-adic completions, ultrametric topology, and the adèle ring are all UMP territory.

Existing assets mapped: - [hensel-code-system/](#) — Exact p-adic arithmetic resolving the Ostrowski gap - [adelic-qft/](#) — Adelic quantum field theory unifying all completions - [unity-of-ultrametric-physics/](#) — The comprehensive case for ultrametric geometry - [arithmetic-gauge/](#) — Gauge-theoretic interpretation of arithmetic structures

This paper contributes: - The cross-domain Rosetta Stone (Section 3) translating UMP concepts into Physics, CS, Cognition, and Info Theory - The convergent principle: “shared ancestry vs. accumulated effort” - The foundational hierarchy showing UMP's position in the full abstraction ladder

7.2 SLB — Laws of Form

WBS Code: QNFO.SLB

The Laws of Form pillar covers the distinction calculus, the void/unmarked state, and the Spencer-Brown formalism. This is where the foundational ladder bottoms out.

Existing assets mapped: - The five-pillar synthesis paper ([wbs-6-synthesis/docs/](#)) already establishes SLB as a canonical pillar

This paper contributes: - The void $\rightarrow$ distinction $\rightarrow$ ZFC $\rightarrow$ valuation chain (Section 4) - The three-path extension: category theory, quantum vacuum, minimum entropy - The paradox of the void: naming the unnameable

7.3 INM — Infomatics

WBS Code: QNFO.INM

Infomatics covers measurement theory, information-theoretic formulations, Kolmogorov complexity, and the bit as the fundamental unit.

Existing assets mapped: - The “Two Ways of Measuring” project (two-ways-of-measuring/) - The valuation-independent foundations paper (memory reference: ump/paper/valuation-independent-foundations)

This paper contributes: - The information-theoretic translation of valuation theory: Kolmogorov complexity as the non-Archimedean “size” - The “booting a universe” entropy calculation: $S = 0 \rightarrow S = k_B \ln 2$ - The Universal Consilience Prompt’s Information Theory translations

7.4 CFE — Consilience Framework Execution

WBS Code: QNFO.CFE

CFE is the meta-pillar that operationalizes cross-domain translation.

This paper contributes: - The Universal Consilience Prompt template (Section 5) — a formalized CFE tool - The autonomous four-phase LLM workflow (Section 6) — a CFE execution protocol - The MCP tool implementation (consilience-mcp/server.py) — a CFE software artifact

7.5 RES — QNFO Research

WBS Code: QNFO.RES

RES covers the research methodology, literature search, and autonomous discovery infrastructure.

This paper contributes: - The four-phase autonomous research loop as a formal RES protocol - The gap-matrix method for identifying novel hypothesis zones - The generative transfer technique for cross-domain theorem creation

7.6 WBS Code Assignment Summary

All deliverables fall under QNFO.CON.002 (consilience-framework), a new project in the Cross-Pillar Consilience program (QNFO.CON). Registration is pending per §7 of WBS.TAXONOMY.md.

Deliverable	WBS Code	Phase
Synthesis paper (this document)	QNFO.CON.002.P4.T1	P4 (Deep Research)
Foundational chain memo	QNFO.CON.002.P4.T2	P4 (Deep Research)
Cross-domain Rosetta Stone	QNFO.CON.002.P4.T3	P4 (Deep Research)
Autonomous LLM workflow spec	QNFO.CON.002.P4.T4	P4 (Deep Research)
Consilience MCP tool	QNFO.CON.002.P5.T1	P5 (Publication)

Project QNFO.CON.002 sits alongside the existing QNFO.CON.001 (wbs-6-synthesis / Five Pillars paper) under the Cross-Pillar Consilience program.

8. Part VII: The Convergent Insight

8.1 The Unified Kernel

When we trace the full hierarchy — void → distinction → completion → measurement → structure — a single kernel emerges:

$$\text{Valuation: } S^2 \rightarrow \mathbb{N} \cup \{\infty\}$$

This is the formal statement from the valuation-independent foundations paper (memory reference). A valuation is a **graded distinguishability map** that assigns a hierarchical depth to every pair of elements. The ultrametric inequality $v(x, z) \geq \min(v(x, y), v(y, z))$ encodes the tree-like nature of distinction itself.

8.2 What This Framework Achieves

- Unifies mathematics and physics:** The same structural dynamic (hierarchical measurement) explains both the real continuum and p-adic trees, both classical spacetime and quantum discreteness.
- Explains the Ostrowski gap:** The fact that there are exactly two Archimedean completions ($\mathbb{R}, \mathbb{C}$) but infinitely many non-Archimedean ones ($\mathbb{Q}_p$) reflects the fundamental asymmetry between continuous (smooth, additive) and discrete (hierarchical, ultrametric) modes of measurement.
- Enables automated consilience:** The Universal Consilience Prompt + four-phase workflow allows an LLM to systematically translate any mathematical theorem across domains, identifying structural isomorphisms and generating novel cross-domain hypotheses.
- Provides a foundation for everything:** The void → distinction → ZFC → valuation chain shows that the entire edifice of formal knowledge rests on a single primitive act — drawing a boundary — and that valuation theory is the natural language for describing the *depth* of those boundaries.

8.3 The Consilience Capsule

“The void is the ground. Distinction is the seed. Mathematics, physics, and information are the forest.”

Domain	Void	Distinction	Forest
Math	$\emptyset$	$\in$ (membership)	ZFC, valuation theory
Physics	Quantum vacuum	Symmetry breaking	Spacetime, particles
Informatics	$S = 0$	The first bit	Computation, information

Domain	Void	Distinction	Forest
Cognition	Pre-conceptual awareness	Categorization	Knowledge, science

9. Part VIII: Predictions & Future Work

9.1 Falsifiable Predictions

Following the KIF-18 symmetry template from the valuation-independent foundations paper, we register three predictions:

Prediction 1 (Physics — UMP). The transition from quantum (ultrametric) to classical (Archimedean) behavior occurs precisely when a system is forced to make an Ostrowski choice — i.e., when measurement collapses the superposition of completions into a single geometric mode. This predicts a measurable “Ostrowski threshold” in decoherence experiments where the ultrametric topology breaks down.

Prediction 2 (CS — CFE). Any optimization problem solvable by gradient descent can be reformulated as a p-adic valuation descent, and the latter will require $\mathcal{O}(\log N)$ iterations vs. $\mathcal{O}(N)$ for gradient descent, where N is the problem dimension, *provided* the problem has a natural hierarchical (tree-like) structure.

Prediction 3 (Info Theory — INM). The minimum entropy required to “boot” a universe from the void is exactly $S_{\min} = k_B \ln 2$ — one bit, one distinction. The recursive cascade that generates all mathematics has Kolmogorov complexity $K = 0$ (the void) plus a constant c for the recursive distinction operator, making the entire edifice of formal knowledge *algorithmically trivial* modulo the distinction primitive.

9.2 Frontier Questions

1. Can the distinction operator be formalized as a monad in category theory, unifying Spencer-Brown with Lawvere-Tierney topology?
2. Does the adèle ring $\mathbb{A}_{\mathbb{Q}}$ provide a complete “theory of everything” for measurement — encoding all possible completions of the void?
3. Can the four-phase autonomous LLM workflow discover a genuinely novel cross-domain theorem (i.e., one not previously published in any domain)?
4. What is the physical mechanism for the Ostrowski choice in quantum measurement — i.e., what forces a system to pick between Archimedean and non-Archimedean geometry?

9.3 Next Steps

1. **Publish this synthesis** as a Zenodo memo (DOI-tracked) under the CFE WBS code
2. **Deploy the MCP tool** as a Cloudflare Worker with D1/Vectorize state persistence
3. **Run Phase A** of the autonomous workflow on a corpus of 20 recent ArXiv abstracts across math, physics, and CS
4. **Integrate** the foundational chain with the existing `adelic-qft/` modules for the spacetime emergence prediction

5. **Cross-reference** the distinction calculus with the hensel-code-system/ paper’s Ostrowski-gap framing

Appendix A: MCP Tool Reference

The Universal Consilience Prompt and four-phase autonomous workflow are implemented as a Python FastMCP server in `/consilience-mcp/server.py`. Tools:

Tool	Description
<code>translate_theorem(theorem, name)</code>	Run the Universal Consilience Prompt
<code>phase_a_corpus_ingestion(abstracts)</code>	Extract mathematical verbs from abstracts
<code>phase_b_cross_mapping(theorem)</code>	Translate a single theorem across domains
<code>phase_c_pattern_matching(translations)</code>	Cluster into meta-principles, find gaps
<code>phase_d_generative_transfer(gap)</code>	Generate novel cross-domain theorem
<code>full_pipeline(abstracts)</code>	Run all four phases automatically

Appendix B: WBS Code Quick Reference

Pillar	Code	Full Name
UMP	QNFO.UMP	Ultrametric Physics
